

Data breaches
cost billions each year.

They're getting worse.

Vaultize gives you total security and control of your documents, files and data from the moment of creation to the server wipe. Protect, track and automatically version your documents and control access in and outside your network with Vaultize's reliable, simple system. [Learn more.](#)

Why Choose Vaultize?

Control

- DRM protection: give and revoke access rights (view, edit, print, share further, etc.) instantaneously.
- Maintain full visibility and control of location, device, time and people.
- Sharing and security control at admin and user level.

Enable

- Access files from anywhere, any device, at any time.
- Share and send larger files internally and externally without sacrificing control.
- Collaboration tools are built in for better security.

Protect

- Keep data encrypted while it's stored and during and after transit.
- Set access policies with advanced DRM
- Data stays encrypted throughout its lifecycle, regardless of location.

Track

- Track files by location, network and user.
- Ensure a complete audit trail regardless of who owns the devices used to access data.
- Easily and immediately shut down access to files.

No data is safe without cradle-to-grave, always-on protection

Do you know where your files have been or who's opening them? How do you track them?

How do you control DRM policies for your documents regardless of who has them?

Over 90 percent of breaches involve error or theft among the breached company's ranks.

\$4 million: The average cost of a single data breach in 2016.

74 percent of CISOs believe employees may be disclosing or stealing data.

One platform. Total security.

powered by Vaultize

Built with your regulatory and business needs in mind

The Vaultize platform was purpose-built from the ground up with compliance and security as primary objectives. It's not a tool that was built only for sharing or editing with some security features tacked on. And we can deploy our solution according to your needs: on premise with our hardware and software, on premise with your hardware, or completely remotely via our secure cloud.

Stay on top of your risk with advanced DRM

We take an information-centric approach to enterprise file security. Our micro-containerization processes embed rights management (DRM/IRM) within documents themselves independent of file formats. The files shared across the corporate fence are encrypted and only usable by authorized recipients and within an authorized environment.

Data encryption and versioning anywhere

Vaultize is built to help you and your employees continuously protect and version your documents without thinking about it. Server and endpoint de-deduplication and military-grade, AES 256-bit encrypted containerization and access controls for every document provides security anywhere on any device without risk of data falling into the wrong hands.

File-centric design as easy to use as your OS

Company-wide adoption of our technology is simple because our platform behaves like a native OS file system. You can fluently gain a totality of control over your documents and employee behavior without trial and error in obscure software.

Explore the ease of use and seamlessness of our comprehensive infrastructure security platform.
